

Introduction To Java (Class 1)

-Pratiksha Dhavale

Overview

- Java programming language was originally developed by Sun Microsystems which was initiated by James Gosling and released in 1995
- **Features**
 - Platform Independent
 - Object Oriented
 - Distributed
 - Dynamic
 - Multithreaded
 - Interpreted
 - Robust

Platform Independence

Application

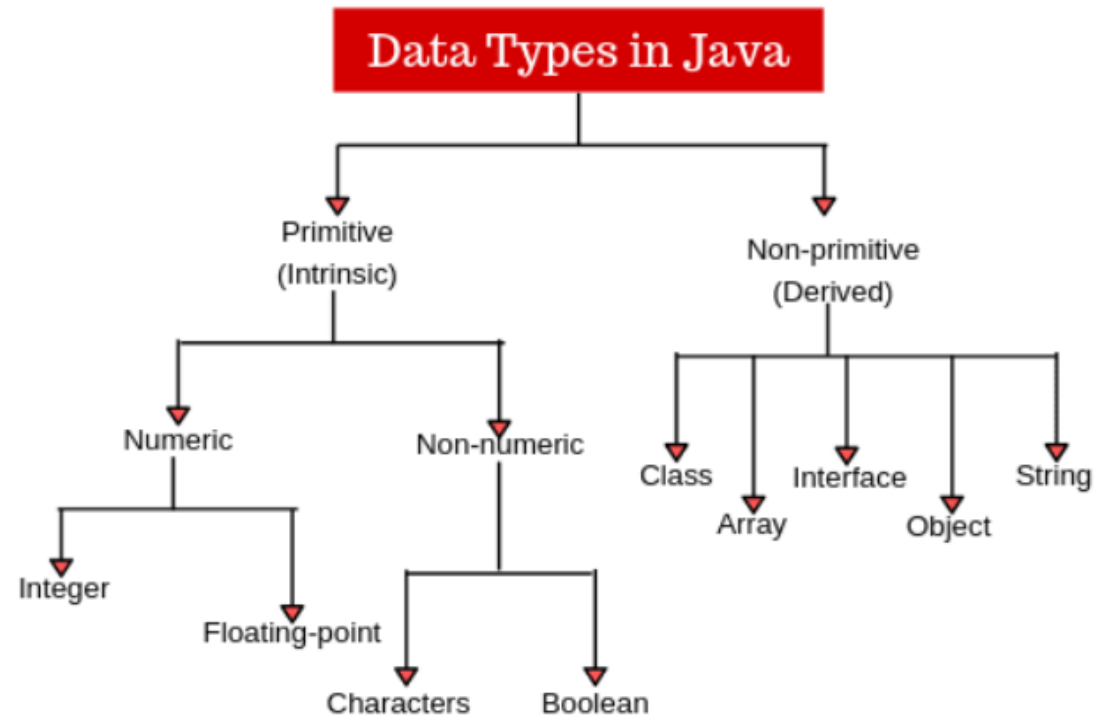

- Mobile Applications.
- Desktop GUI Applications.
- Web-based Applications.
- Enterprise Applications.
- Scientific Applications.
- Gaming Applications.
- Big Data technologies.
- Business Applications.
-

Variables & data types

A variable is user-defined. It is a quantity that may change within the context of a mathematical problem or program. There is no specific command assigned to make a variable. Instead, it creates the movement you want to assign some value or store some value to it.

Variables & Data types

Operators(Arithmetic operators)

Operator	Operation
+ (Addition)	$z = x + y$
- (Subtraction)	$z = x - y$
* (Multiplication)	$z = x * y$
/ (Division)	$z = x / y$
% (Modulus)	$z = x \% y$

Operators(Comparison)

Comparison operators:

- Comparison operators are also called relational operators.
- It compares the values of two operands and returns True or False based on whether the condition is met.
- For an understanding, look at the image attached below.

Operators	Meaning	Example	Result
<	Less than	5<2	False
>	Greater than	5>2	True
<=	Less than or equal to	5<=2	False
>=	Greater than or equal to	5>=2	True
==	Equal to	5==2	False
!=	Not equal to	5!=2	True

Conditional Statements

Conditional statements are used to perform some task based on the condition.

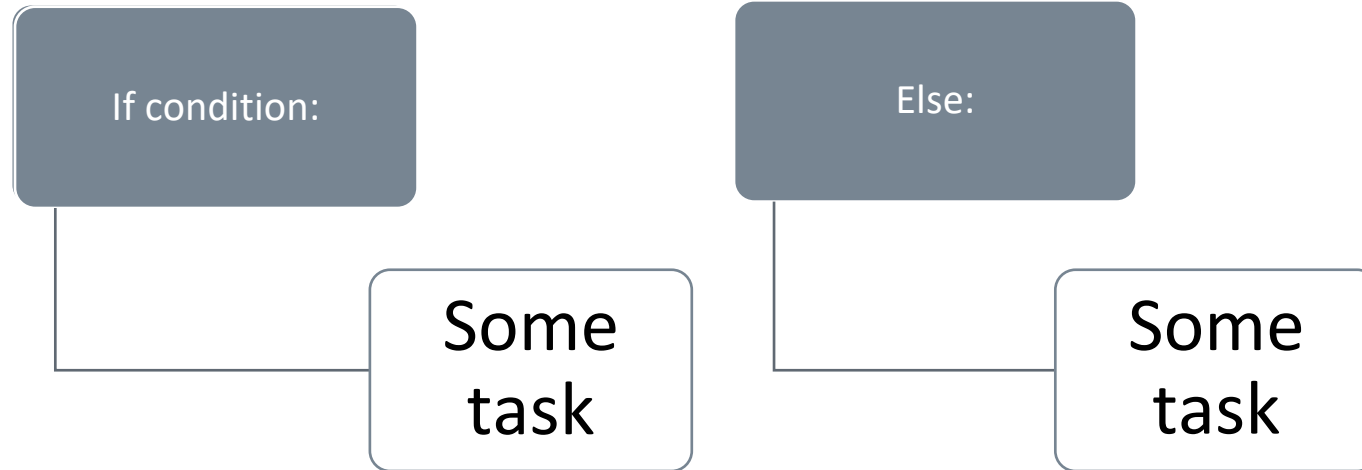

Eg :-

Father : Son/Daughter if you get more than 90% I will buy you a bike/mobile.Else you will not get anything.

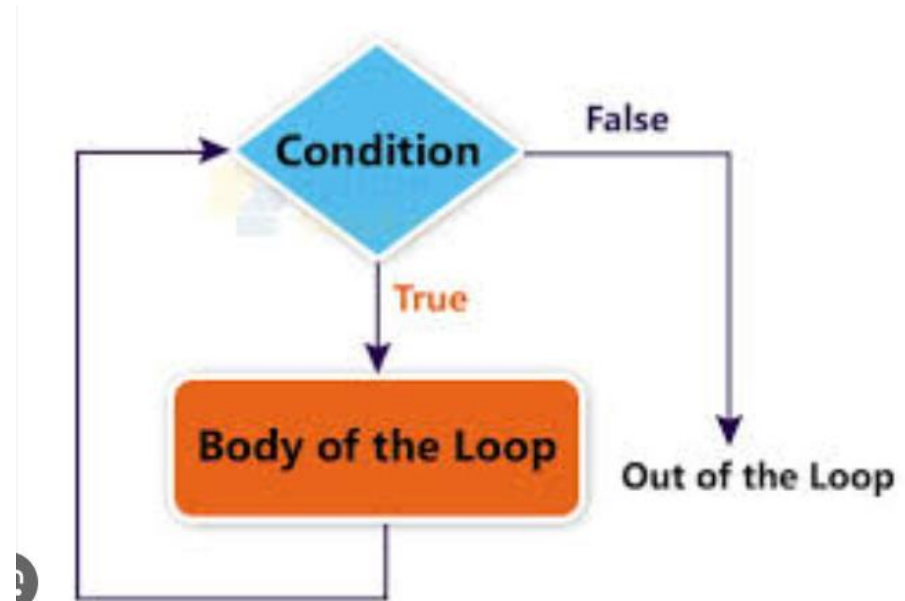

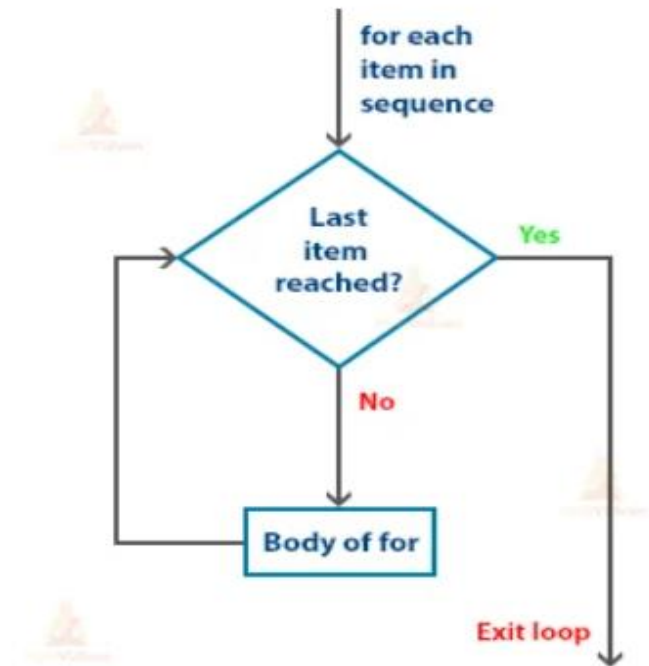

In the above example we can see based on a condition parent is going to perform specific task.

Loops

- used to execute a block of statements repeatedly

Operation of for Loop

Functions

- A **method** is a block of code which only runs when it is called.
- You can pass data, known as parameters, into a method.
- Methods are used to perform certain actions, and they are also known as **functions**.

- ```
public class Main {
 static void myMethod() {
 System.out.println("I just got executed!");
 }
}
```

- ```
public static void main(String[] args) {  
    myMethod();  
}  
}
```

Q & A
